WE SUPPLY INVERTER AND NON INVERTER AIR CONDITIONING UNITS

The biggest difference between these two types of air con lies in the functionality of the inverter, the best tool to save electricity. The inverter in Inverter air con helps to control the speed of the compressor motor, thereby changing the temperature as per requirement. This can reduce the electricity consumption of your air conditioner while in Non-inverter air-con's the compressor motor it operates at complete capacity or non at all and switched off. This can cause unwanted current consumption and high electricity bill.

Any installation that exceeds the standard back to back installation guides will be charged additionally and separately
